

Outline

- Motivation
 - History of design pattern
 - Pull vs Push & Concurrency
 - Why reactive programming?
- Observable
- Observer
- Subscription
- Factories
- Subjects
- Managing Subscriptions
- Hot vs. Cold Observables
- Observables vs. Promises

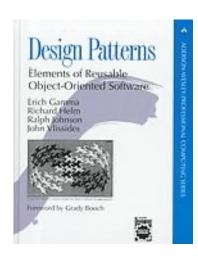

Motivation

Once upon a time

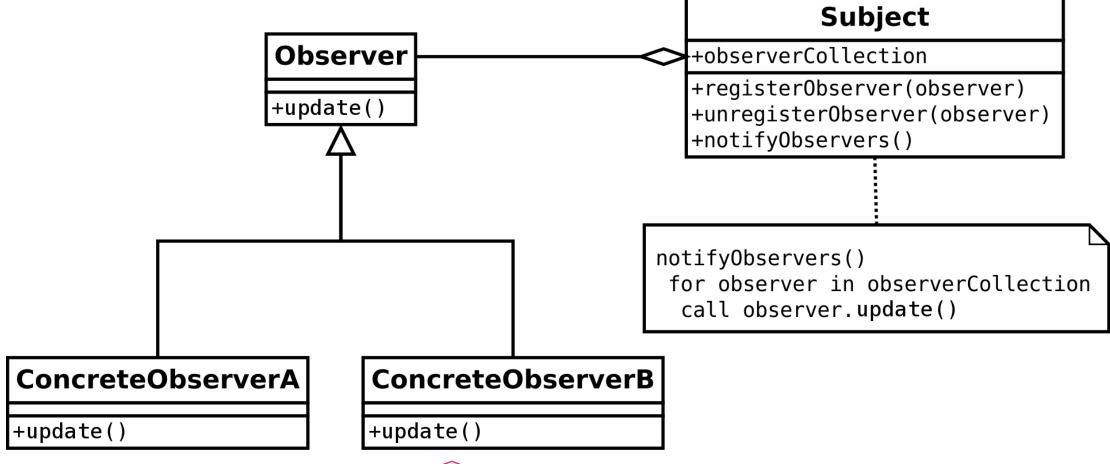

- Design Patterns (1994 Gang Of Four)
 - Iterator Pattern (Behavioral Design Pattern)
 - Decouble data from alogrithms

```
class Iterable {
  [Symbol.iterator]() {
    ...
  }
}
const iterable = new Iterable();
for (const item of iterable) {
    ...
}
```

Observer pattern (Behavioral DP)

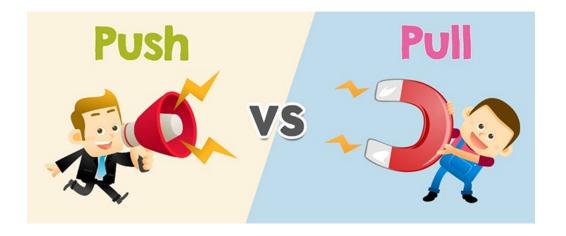

Pull vs Push Architecure (I)

- Pull-based
 - Consumer decide when data is pulled
 - Producer unaware when
 - Every function is a producer

- Get notified when changes happen
- E.g. Mobile App Push Notifications

Pull vs Push Architecure (II)

	Producer	Consumer
Pull	Passive: produces data when requested.	Active: decides when data is requested.
Push	Active: produces data at its own pace.	Passive: reacts to received data.

Concurrency (I)

- Synchronous vs. asynchronous computing
 - Latency → wait time
- Non-blocking code with callbacks
 - Often used in JavaScript

Concurrency (II)

	Single items	Mulitple items
synchronous / Pull	Function	Iterable (Array)
asynchronous / Push	Promise / async await	?

Concurrency (II)

	Single items	Mulitple items
synchronous / Pull	Function	Iterable (Array)
asynchronous / Push	Promise / async await	Observable / Signal

Why asynchronicity?

Asynchronous operations (API requests)

Interactive behavior (user input)

Websockets

Server Send Events (Push)

Why reactive programming?

- Enhances the user experience to be more fluid and responsive
- Simple to manage by developer
 - avoid "callback hell" → instead cleaner, readable code base
 - simple to compose / combine streams of data
 - simpler than traditional threading
- Powerful RxJS operators (best practices)
- But difficult to learn and can it cause memory leaks

Observables & Observer

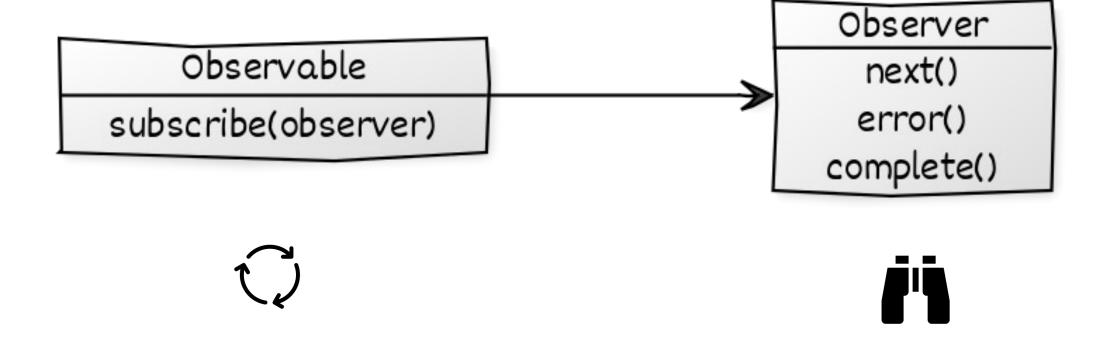

What are observables?

- Represents (asynchronous) data that is published over time
- A collection of values over any amount of time
 - 0..N values could be emitted
- Cancellable
- Lazy
- Operator support
 - Ton of functionality ©

Observable and Observer

Subscribing an Observer

Observer

```
myObservable.subscribe(
   (value) => { ... }
);
Observer
```

Observer

myObservable.subscribe(

```
(value) => { ... },
(err) => { ... },
() => { ... }
```

Option with multiple parameters was deprecated in V 6.4 and will not be supported in V 8 (soon!)

Observer

```
myObservable.subscribe({
    next: (value) => { ... },
    error: (err) => { ... },
    complete: () => { ... }
});
Observer
```

Creating Observables

Creating an Observable (rarely done this way)

```
let observable = new Observable((sender) => {
    sender.next(4711);
    sender.next(815);
    // sender.error("err!");
    sender.complete();
});
Sync/Async, Event-driven
Sync/Async, Event-driven
```

```
let subscription = observable.subscribe(...);
subscription.unsubscribe();
```

Creation Operators (Factories)

[https://www.learnrxjs.io]

fromEvent

of

throwError

interval

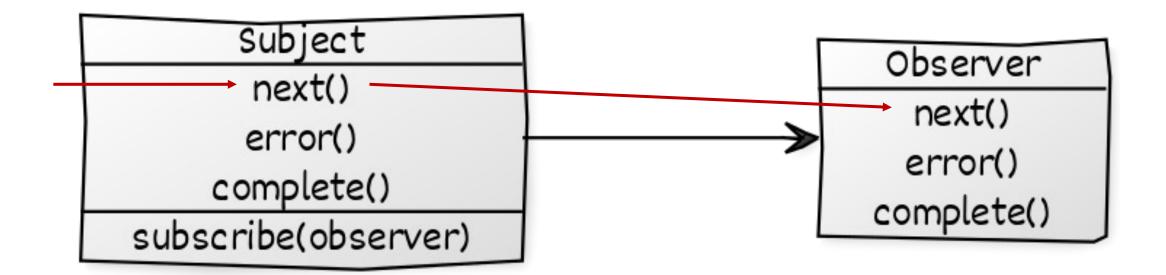

timer

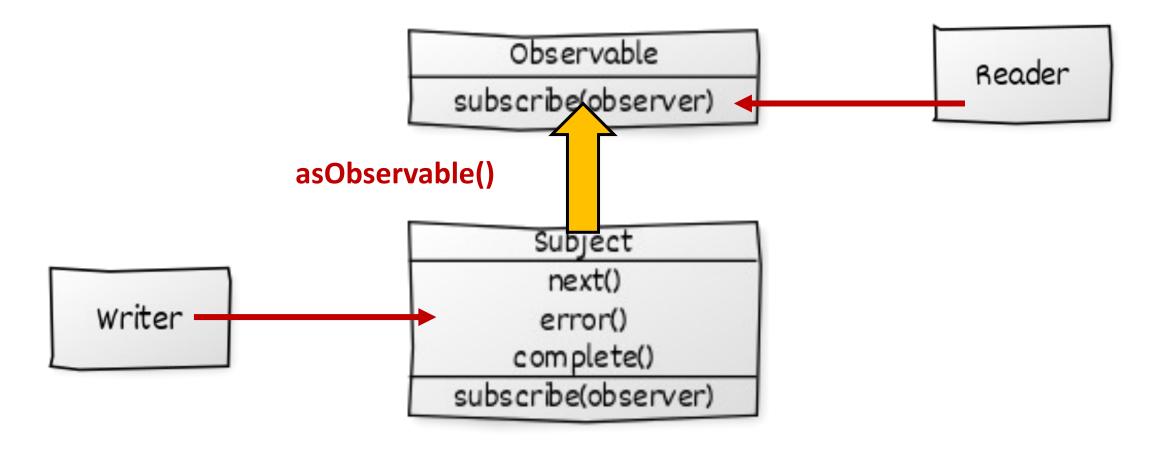

Subjects

Subjects: Special Observables

Convert Subject into Observable

asObservable

```
private subject = new Subject<Flight>();
readonly observable = subject.asObservable();

[...]
this.observable.subscribe(...)

[...]
this.subject.next(...)
```

Subjects

Subject

Hot & distributes data

BehaviorSubject

Saves last value, has initial value

ReplaySubject

Saves last x values

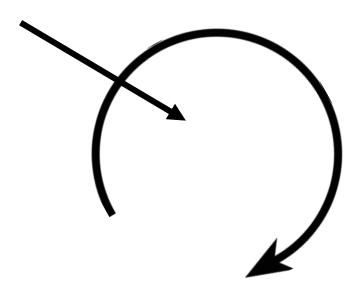

Eventing with Subject

```
const sub = new Subject<Flight>();
sub.subscribe((flight) => console.debug(flight));
sub.next({ id: 1, ...})
```

Subjects

Data/Notification

Subject

```
.subscribe({
    (result) => { ... },
    (error) => { ... },
    () => { ... }
});
```

Observer

State with BehaviorSubject

```
const temperature = new BehaviorSubject<number>(0);
temperature.subscribe((temp) => console.debug(temp));
temperature.next(-5);
```

Diff with ReplaySubject

```
const diff = new ReplaySubject<number>(2);
```

```
replaySubject (2)
Stopped Closed false false
```

Managing Subscriptions

Why do we (always!) need to unsubscribe?

Avoid side effects

Avoid memory leaks

Also for HttpClient's get / post ...

Howto cancel subscriptions

Explicitly

```
let subscription = observable$.subscribe(...);
// subscription.add(otherObservable$.subscribe(...)); // also possible since V6
subscription?.unsubscribe();
```

- Implicitly
 - observable\$.pipe(takeUntil(otherObservable)).subscribe(...);
 - observable\$.pipe(takeUntilDestroyed()).subscribe(...);
- Implicitly with async-Pipe in Angular

```
{{ observable$ | async }} ——
```

also triggers a cdr.markForCheck for OnPush

- Automatic by Angular
 - Angular Router Params (the only 1 I know where unsubscribing is not needed)

DEMO: Cancelling Subscriptions

Cold vs. Hot Observables

Cold vs. Hot Observables

Cold

- Point to point
- Lazy: Only starts at subscription

Default

Hot

- Multicast
- Eager: Sender starts without subscriptions

Create Hot Observable

Create Hot Observable

```
let o = this.find(from, to).pipe(share());
o.subscribe(...);
Sender starts with first subscription
```

Sender stops after all receiver have been unsubscribed

Create Hot Observable

DEMO: Hot Observable

Lab

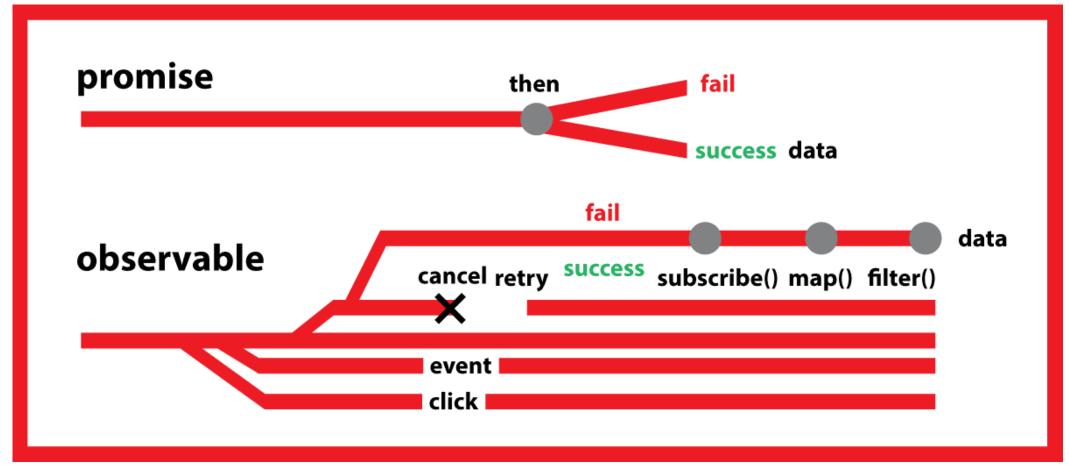

RxJS Basics

Observables vs Promises

Observables vs Promises – Overview

Observables vs Promises – Details

Observables (Streams)	Promises (Single Event)	
More features	Less powerful	
Can emit zero, one or multiple values over time.	Emit a single value at a time.	
Lazy : they're not executed until we subscribe using the subscribe() method.	Eager: execute immediately after creation.	
Subscriptions are cancellable using the unsubscribe() method, which stops the listener from receiving further values.	Are not cancellable .	
RxJS provides a ton of functionality to operate on observables like the map, for Each, filter, reduce, retry, and retryWhen operators.	Don't provide any operations.	
Deliver errors to the subscribers.	Push errors to the child promises.	
Used by HTTP Client, Reactive Forms & Route Params	Used by Angular in Router.navigate	

Recap
